Fire Hydrant Flow Test Maintenance

One of the core maintenance tasks for a working utility system is to periodic conduct fire hydrant flow tests at designated sites throughout the city. The purpose of this task is to determine the availability of safe, high-quality drinking water and to ensure that there is adequate pressure within the supply for fire-fighting capabilities. While no municipality wants to endure any kind of fire, it is best practice to ensure the City's water system is always ready to address an emergency.
