Utilities Team Replaces Water Service Line

The Utilities Division recently replaced a 1½-inch water service line located in the alleyway near 5th Street after a leak was discovered in the existing plastic service line. To ensure a long-lasting and dependable repair, Utilities operators installed a new 1½-inch copper service line and carefully backfilled the area once the work was completed.

This upgrade not only resolved the immediate leak but also enhances the reliability of the City's water infrastructure. Copper service lines are more durable and resistant to corrosion, reducing the likelihood of future leaks and maintenance needs. Projects like this reflect the City's ongoing commitment to providing safe, high-quality water and maintaining the essential systems that serve our community.
