Water Service Upgrade Enhances Reliability for Local Homes

During a routine inspection, our Utilities crew found a residential $\frac{5}{8}$ -inch water meter that needed replacement—and because it sat outside the City's right-of-way, it had to be relocated. When crews excavated the main line, they discovered an unconventional setup of a single $1\frac{1}{2}$ -inch service fitting that supplied two homes from one tap source. This was a decades-old connection that was badly corroded and leaking.

To repair the issue, the water operators:

1. **Removed and capped the faulty service fitting** to stop the leak.
2. **Tapped two (2) brand-new 1-inch service lines** from the main.
3. **Installed new meters and protective boxes** in the correct right-of-way location.
